Homework 4
O Max Anderson

       My programs work without issue save for one detail. The template file has a couple of lines that contain tabs: the name/course line and the total/subtotal/deductions line. When writing the code I decided to tokenize each line in order to process each word by itself. This meant I had to separate on both tabs and spaces. I didn't realize the issue this would cause when I was trying to piece it back together until I had already gotten the functionality completed. Therefore, the output file doesn't have those tabs included, just spaces. I could have gotten around this by deciding not to tokenize and to just iterate through each line looking for tags, but I decided it wasn't a big enough issue to completely redo the functionality.

       Aside from this issue, the programs will correctly create files for each record with the appropriate values inserted in place of the tags.
